Concept 10 Kensington Removal Traffic Study
January 22, 2024

Executive Summary:

A supplemental traffic study has been performed to assess the NYS Route 33 Kensington Expressway Removal (Concept 10) with traffic redistribution onto other roadways such as interstates and arterials. Traffic forecasting and redistribution for this scenario primarily utilized the Greater Buffalo Niagara Regional Transportation Council's (GBNRTC) Regional Travel Demand Model. The analysis focused on the ETC+20 design year (Year 2047) for the AM and PM peak hour periods and compared traffic operation for the No-Build scenario to the Kensington Removal (Concept 10) scenario.

This supplemental study provides results for the Measures of Effectiveness parameters of Level of Service (LOS), average delay per vehicle in seconds, travel speeds, and vehicle queuing lengths at intersections. The traffic study assessed the original December 2022 Project Scoping Report (PSR) intersections and roadways which included 62 intersections and 36 roadway segments within the immediate project area. Supplemental analysis is provided for the expanded areawide traffic redistributions for an additional 35 intersections and 40 road segments beyond the original PSR study area.

The PSR provided a screening analysis which utilized the Measure of Effectiveness parameter of Volume to Capacity (V/C) ratio. The PSR analysis compared roadway V/C between the Existing Kensington Expressway and Concept 10 Kensington Expressway Removal scenario (identified as Concept 10 in the PSR). Redistributed traffic under Concept 10 would impact traffic volumes on the remaining NYS Route 33 segment and surrounding roadways, relative to their respective capacities. One method to evaluate the operation of a roadway is to determine the volume to capacity (V/C) ratio. A roadway with a V/C above 1.0 has exceeded the volume that it can manage and can be expected to operate poorly with reduced speeds and significant congestion. Using data obtained from the GBNRTC regional travel demand model, adjacent roadways would be most impacted by the redistribution of traffic due to the implementation of Concept 10 based on 2019 traffic conditions.

Supplemental study intersections (35) and roadway segments (40) were identified for data collection and eventual study. Three consecutive days of traffic field counts for each location were collected over two weeks on October 16, 17, and 18, 2023 and October 24, 25, and 26, 2023.

Concept 10 traffic volumes were developed based on the GBNRTC Regional Travel Demand Model percentage changes due to redistributed traffic for the Kensington Expressway Removal. Field counts were adjusted by location specific percentage change factors to develop the ETC+20 design year condition.

Traffic analysis for the No-Build versus Concept 10 Kensington Expressway Removal scenarios used Synchro Version 11 software for intersections and arterials, and Vissim11 software for freeway segments and ramps.

The original Kensington Expressway Vissim model (2022) was expanded to include expressway segments included in the supplemental traffic analysis in order to compare the No-Build and Kensington Removal scenarios.

From an operations perspective, Concept 10 would result in a major redistribution of approximately 75,000 average daily vehicles throughout the region. The reconstructed Humboldt Parkway would not be able to replace the capacity provided by the expressway and drivers would select alternate routes that would minimize their travel time to their destination under the revised network conditions. It would be difficult for the surrounding freeways, such as NYS Route 198 (Scajaquada Expressway), Interstate 190 (I-190), Interstate 90 (I-90), and arterial roads, such as Fillmore Avenue, Jefferson Avenue, Main Street, and Genesee Street, to accommodate the increase in traffic and delays without major capacity improvements, particularly on the impacted freeway segments and affected intersections which are typically the restricting points in the roadway network.

PIN 5512.52
Concept 10 Kensington Removal Traffic Study
January 22, 2024

2. Road Segments

A traffic analysis was performed using Synchro software to compare the No-Build and Concept 10 scenarios for roadway corridor impacts due to increased redistributed traffic. Speeds, emissions, and fuel consumption were calculated for select roadways which were identified as primary diversion routes.

- Humboldt Pkwy NB & SB – Northampton St to Delaware Ave
- Jefferson Ave – Genesee St to E. Delavan Ave
- Fillmore Ave – Genesee St to E. Delavan Ave
- Main St – E. Ferry to Kensington Ave
- Genesee St – Jefferson Ave to Best St
- Bailey Ave – William St to Delavan Ave

The analysis of segment travel speed, emission and fuel usage indicates that corridors closest to the project area, including Humboldt Parkway NB and SB, Jefferson Avenue, Fillmore Avenue, and Genesee Street are expected to experience reductions in travel speed and increased vehicle emission and fuel usage as a result of the Kensington Expressway removal.

The AM peak travel speeds along the Humboldt Parkway NB and SB corridors would decrease as much as 85.2% to an average of 1.3 mph. Travel speeds along the Jefferson Avenue, Fillmore Avenue, Main Street, Genesee Street, and Bailey Avenue corridors would decrease from 1.3% to as much as 86.1%. The corresponding total peak hour delay time per roadway would increase from 63 hours to 2,163 hours for the study roadways as noted in Table 7-1 of the study.

The PM peak travel speeds along the Humboldt Parkway NB and SB corridors would decrease as much as 82.2% to an average of 0.8 mph. Travel speeds along the Jefferson Avenue, Fillmore Avenue, Main Street, Genesee Street, and Bailey Avenue corridors would decrease from 5.6% to as much as 92.0%. The corresponding total peak hour delay time per roadway would increase from 224 hours to 2,894 hours for the study roadways as noted in Table 7-2 of the study.

Delays and operating speeds would be impacted by implementing Concept 10. The greatest impacts can be expected in the immediate project area and adjacent corridors including Humboldt Parkway NB & SB, Fillmore Avenue, Jefferson Avenue, Main Street, Genesee Street, and Bailey Avenue. The local street network and intersections would not operate at an acceptable LOS and would not be able to adequately accommodate the volume of redistributed traffic from the Kensington Expressway.

3. Freeways

The Concept 10 traffic model predicts that vehicles would experience increased density volumes and lower speeds on already near-capacity roadways and ramps. Significant degradation of LOS and vehicle speed is expected at:

- NYS Route 198 Eastbound between Parkside and NYS Route 33,
- I-90 Eastbound between I-190 and NYS Route 33,
- I-90 Westbound between Cleveland and Walden,
- I-90 Eastbound between William and Walden,
- I-190 Northbound between Route 5 Skyway and Route 198,
- I-190 Eastbound between Michigan and Ogden,
- I-90 Westbound Ramp to NYS Route 33 Westbound, and
- I-190 Eastbound between NYS Route 198 and the Peace Bridge

Other segments and ramps are projected to experience increased density, degraded LOS, or reduced vehicle speed.

PIN 5512.52
Concept 10 Kensington Removal Traffic Study
January 22, 2024

4. Additional Considerations

The traffic study also considered proposed capital projects involving road diets and installation of bicycle lanes, safety, crash history, and air quality impacts as they relate to Concept 10.

- **Road Diets & Bicycle Lanes**
Roadways are programmed for road diets and/or bike lane additions in accordance with the Bike Buffalo Niagara Regional Bicycle Master Plan and the GBNRTC 2023-2027 Transportation Improvement Program (TIP). These projects were incorporated into the traffic modeling and further reduce the number of lanes and capacity of the affected roadways for vehicular traffic.
- **Pedestrian & Bicyclists Safety**
An advantage of accommodating regional traffic movements on an expressway is that direct conflicts with pedestrians and bicyclists are avoided. Pushing traffic flows onto local streets that are also used by pedestrians and bicyclists would increase the number of crashes, injuries and fatalities affecting these vulnerable road users. Further, adding traffic to surface roads conflicts with future local and regional plans.
- **I-90 / Route 33 Crash History**
NYSDOT's Crash Location and Engineering Analysis Repository (CLEAR) safety management system was used to collect safety data for the NY 33 & I-90 interchange. The area includes the full interchange and ramps plus I-90 up to Cleveland Dr where it begins to split to I-290. A total of 460 crashes occurred during the most recent 3-year study period. This already problematic interchange would likely see increases in the number of crashes, injuries, and fatalities due to additional redistributed volumes.
- **Regional Air Quality**
Air emissions were calculated using the Synchro microsimulation traffic model for adjacent arterial roadways to the project. The traffic simulation analysis for specific roadway segments and intersections with volume increases and delay also experience increased mobile source emissions. Vehicle emissions of CO, HC, and Nox under stop-and-go traffic conditions on local streets with traffic signals result in higher emissions than the same traffic travelling in free-flow conditions on an expressway.

5. Concept 10 Construction Cost Estimate

An opinion of probable construction cost is defined as a level one cost estimate to facilitate budgetary and feasibility determinations, based on historical information with adjustments made for specific project conditions. Preliminary cost estimates indicate that the Concept 10 cost including filling in, and costs associated with mitigation measures required to accommodate the traffic diversions would likely exceed twice the cost of the current project.

PIN 5512.52
Concept 10 Kensington Removal Traffic Study
January 22, 2024

1. Introduction:

In response to public comments to further investigate the complete removal of NYS Route 33 (Kensington Expressway) between NYS Route 198 and Downtown Buffalo, a supplemental traffic study has been performed to assess the Kensington Expressway Removal (Concept 10) with traffic redistribution onto other roadways such as interstates and arterials. Traffic forecasting and redistribution for this scenario utilized the Greater Buffalo Niagara Regional Transportation Council's (GBNRTC) Regional Travel Demand Model.

This traffic study assessed the original Project Scoping Report (PSR) intersections and roadways. Supplemental analysis is provided for the expanded areawide traffic redistributions for an additional 35 intersections and 40 road segments beyond the original PSR study area. The analysis focused on the ETC+20 design year (Year 2047) for the AM and PM peak hour periods and compared traffic operation for the No-Build scenario to the Kensington Removal scenario. The study presents a comparison of relevant metrics for the intersections, roadway segments, and freeways / ramps analyzed including Level of Service (LOS), delay, queue lengths, travel times / speeds, and emissions / energy usage.

2. Background:

The PSR provided a screening analysis which compared roadway Volume to Capacity (V/C) ratios between the Existing Kensington Expressway and Concept 10 Kensington Expressway Removal scenario (identified as Concept 10 in the PSR). Redistributed traffic under Concept 10 would impact traffic volumes on the remaining NYS Route 33 segment and surrounding roadways, relative to their respective capacities. One method to evaluate the operation of a roadway is to determine the volume to capacity (V/C) ratio. A roadway with a V/C above 1.0 has exceeded the volume that it can manage and can be expected to operate poorly with reduced speeds and significant congestion. Using data obtained from the GBNRTC regional travel demand model, the following roadways would be most impacted by the redistribution of traffic due to the implementation of Concept 10 based on 2019 traffic conditions. See Table 1 for V/C ratios

- NYS Route 33 Eastbound from NYS Route 198 to Grider Street: V/C ratio would increase over 33% in the PM peak hour with a V/C above 1.0.
- I-90 is already operating near or above a V/C ratio of 1.0; the V/C ratio would increase with implementation of Concept 10.
- Main Street Northbound from NYS Route 198 to East Ferry Street: V/C ratio would increase by 37% in the PM peak hour with a V/C approaching 1.0.

*EB – Eastbound, WB – Westbound, NB – Northbound, SB - Southbound

3. Methodology:

The traffic analysis required a complex process that encompassed the greater Buffalo area at key intersections and roadway segments. The original PSR traffic study included 62 intersections and 36 roadway segments within the immediate project area. The supplemental traffic study expanded the traffic modeling to include 35 additional intersections and 40 additional roadway segments to account for regional traffic redistributions associated with Concept 10 Kensington Expressway Removal.

a) Traffic Count Data Collection:

Supplemental study intersections (35) and roadway segments (40) were identified for data collection and eventual study as shown in Tables 2 and 3. Three consecutive days of traffic field counts for each location were collected over two weeks on October 16, 17, and 18, 2023 and October 24, 25, and 26, 2023.

Concept 10 Kensington Removal Traffic Study
January 22, 2024

b) Traffic Data Forecasting:

Concept 10 traffic volumes were developed based on the GBNRTC Regional Travel Demand Model (TDM) percentage changes due to redistributed traffic for the Kensington Expressway Removal scenario. Figures 1-1 and 1-2 show GBNRTC volume percentage changes for AM and PM peaks. Field counts were adjusted by location-specific percentage change factors to develop the ETC+20 design year condition as shown in Appendix A-1 through A-6 for the AM and PM peak hours

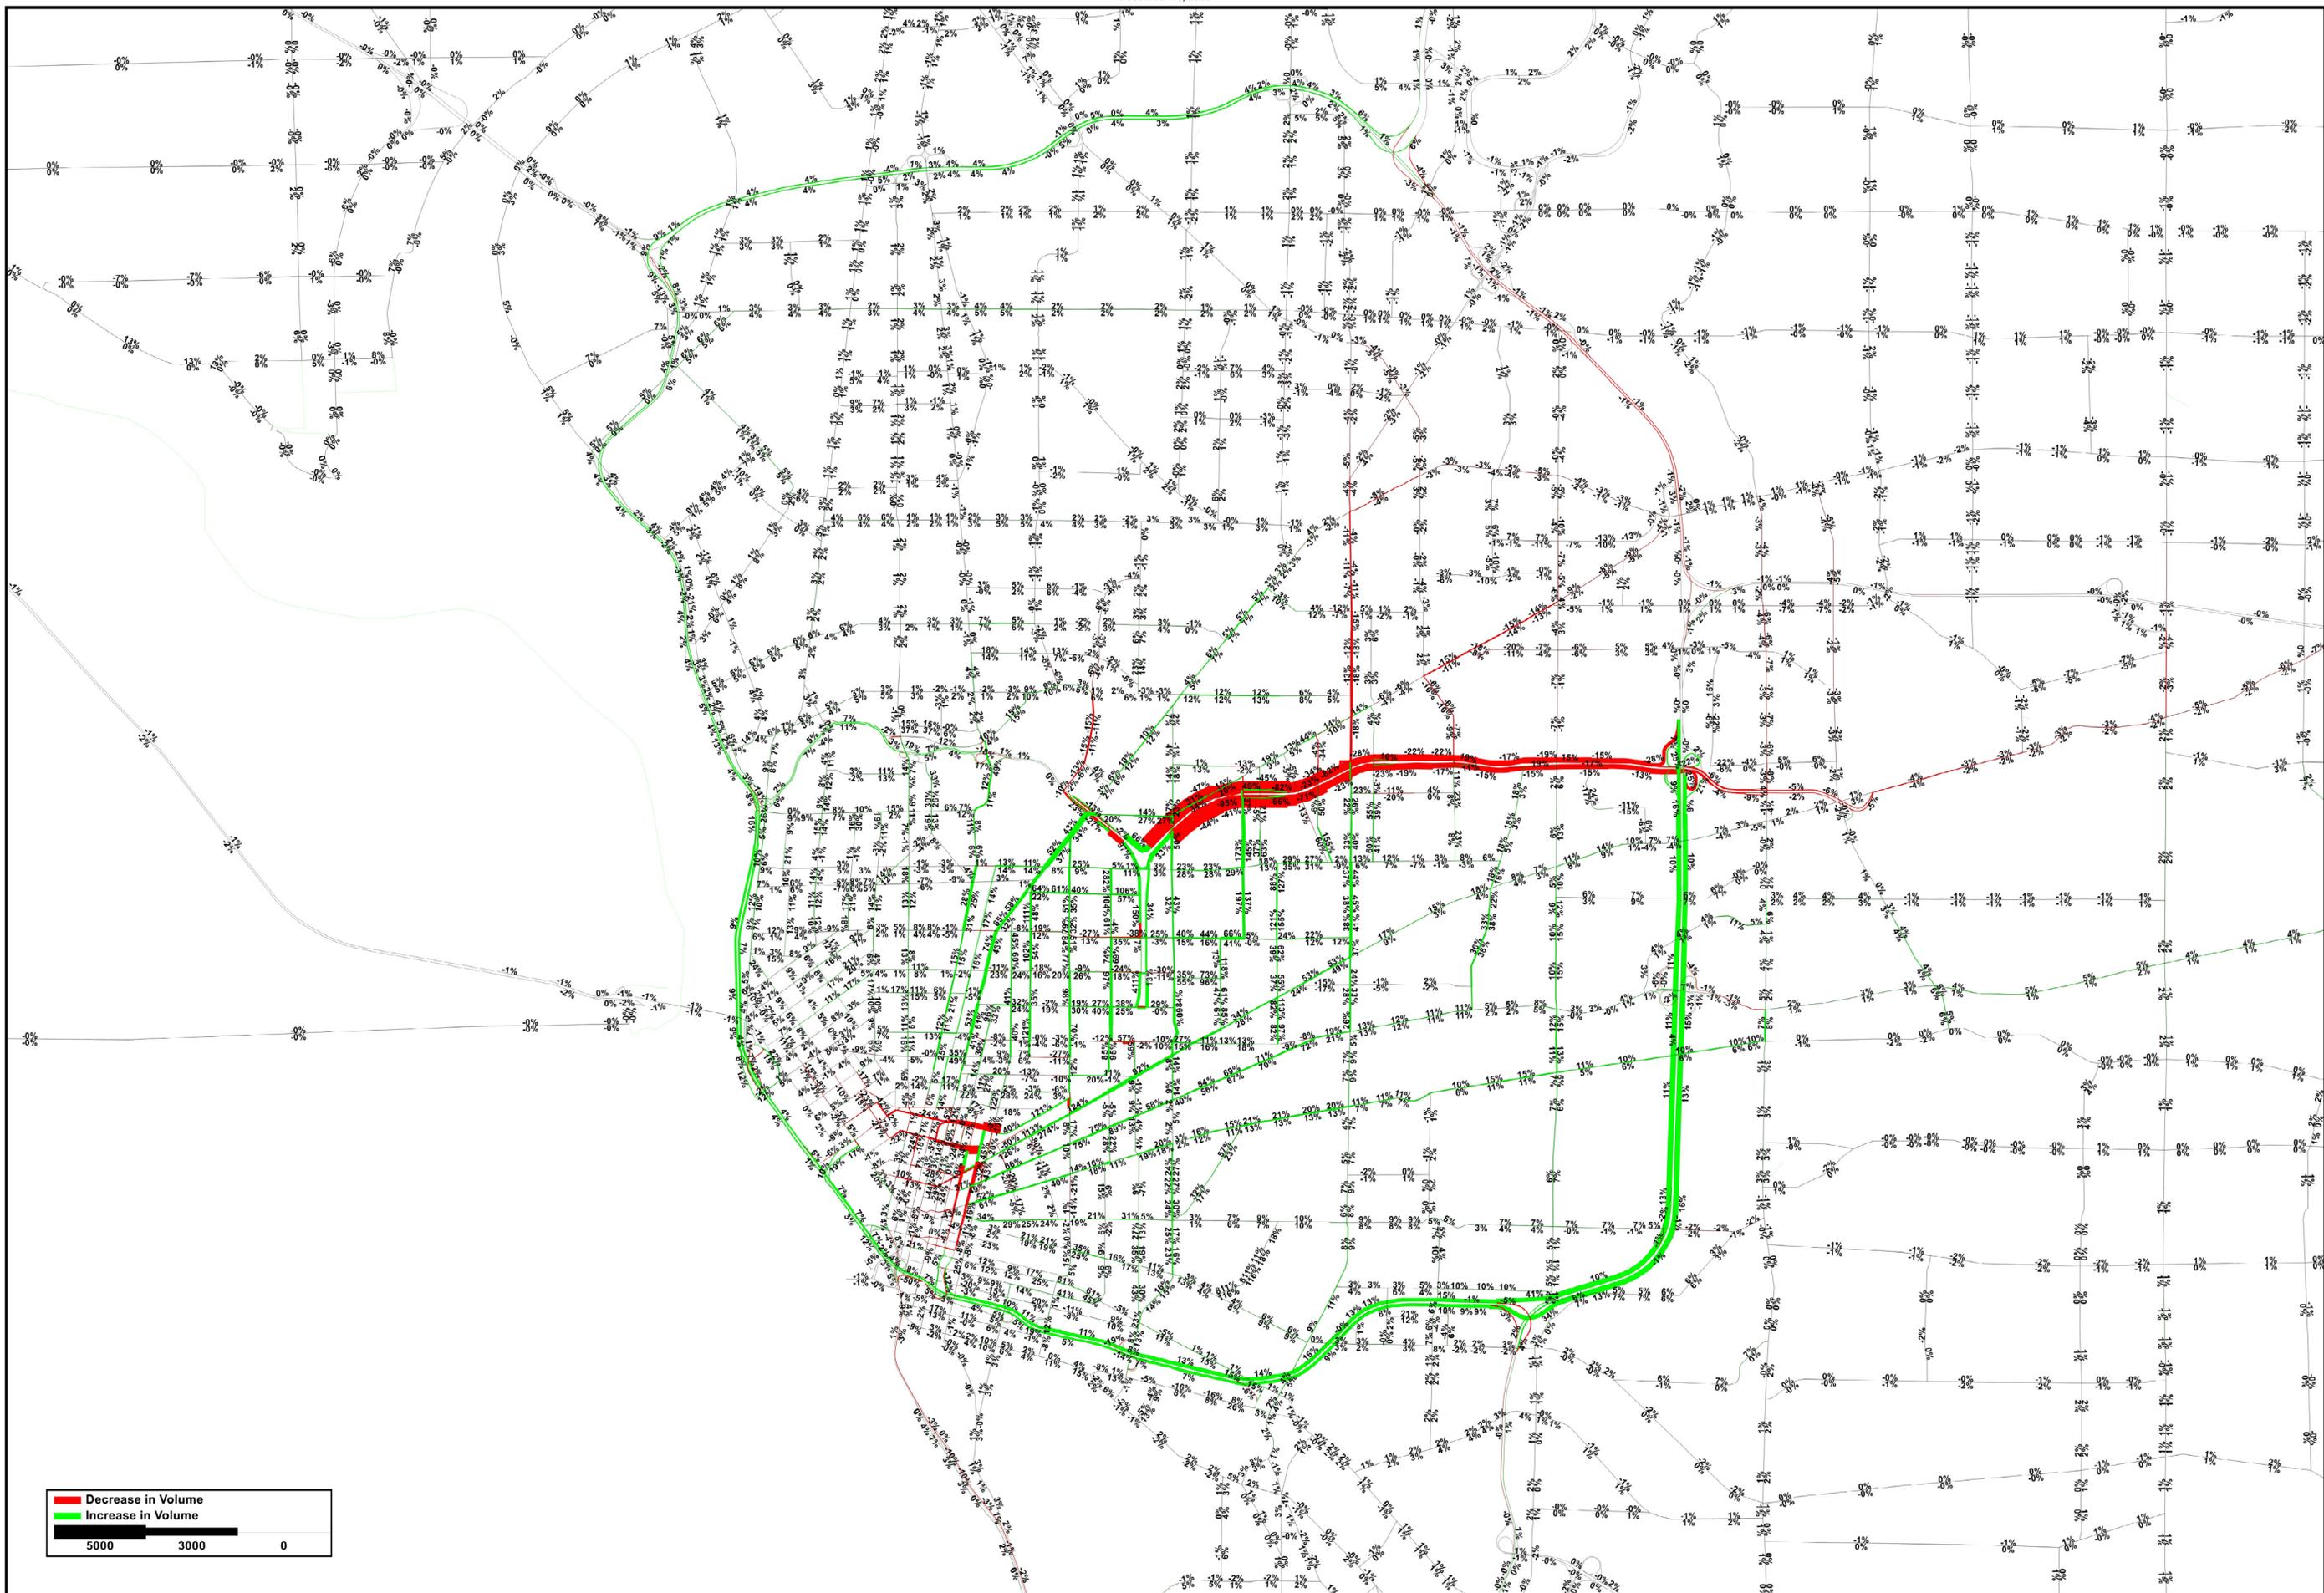

The GBNRTC's TDM used for Concept 10 shows an increase in vehicles in the peak hours as shown in Appendix A-1 through A-6 which will divert to the Humboldt Parkway NB and SB corridors, resulting in near gridlock conditions at the signalized intersections of E. Ferry Street, E. Utica Street, and Northampton Street. Recognizing that under these conditions drivers may choose alternate routes in the immediate project area, a modified traffic distribution scenario was developed that assumed 1,500 vehicles would be the maximum capacity before drivers would divert from the Humboldt NB and SB corridors to the nearest parallel arterial.

Figures 2-1, 2-2, and 2-3 show AM peak hour localized traffic distribution volumes at Humboldt Parkway and adjacent roadways. Figures 2-4, 2-5, and 2-6 shows PM peak hour localized traffic redistribution volumes. In the northbound direction, traffic was diverted using Northampton Street and Fillmore Street. In the southbound direction, traffic was diverted using E. Delavan Avenue, Jefferson Avenue, and Fillmore Street.

c) Traffic Analysis:

Traffic analysis for the No-Build versus Concept 10 Kensington Expressway Removal scenarios used Synchro Version 11 software for intersections and arterials, and Vissim11 software for freeway segments and ramps. The original Synchro traffic model with 62 intersections was expanded to include the 35 supplemental intersections.

The original Kensington Expressway Vissim model (2022) was expanded to add expressway segments I-190, I-90, I-290, and Rt. 198 included in the supplemental traffic analysis in order to compare the No-Build and Kensington Removal scenarios. A Vissim model prepared for NYSDOT's Skyway Removal project was reviewed for consistency.

d) Traffic Findings:

Traffic operation is evaluated and reported using Level of Service (LOS), which is an indication of how an intersection operates and the amount of delay a driver is likely to experience. LOS is reported using six letters ranging from "A" to "F" that correspond with the average delay that a vehicle is expected to experience while completing a turning movement at an intersection. LOS "A" indicates nearly free-flow operation with minimal delay, while LOS "F" indicates significant congestion and delay. Typically, a LOS between "A" and "D" for an overall intersection or individual approach is considered acceptable. A summary of LOS and corresponding delay for signalized and unsignalized intersections is provided in Table 4.

Table 4 - Intersection Level of Service Criteria

| Level of Service | Signalized Intersection Control Delay per Vehicle (seconds) | Unsignalized Intersection Control Delay per Vehicle (seconds) |
|------------------|---|---|
| A | < 10 | < 10 |
| B | 10 to 20 | 10 to 15 |
| C | 20 to 35 | 15 to 25 |
| D | 35 to 55 | 25 to 35 |
| E | 55 to 80 | 35 to 50 |
| F | > 80 | > 50 |

From an operations perspective, Concept 10 would result in a major redistribution of approximately 75,000 average daily vehicles throughout the region. The reconstructed Humboldt Parkway would not be able to replace the capacity provided by the expressway and drivers would select alternate routes that would minimize their travel time to their destination under the revised network conditions. It would be difficult for the surrounding freeways, such as NYS Route 198 (Scajaguada Expressway), Interstate 190 (I-190), Interstate 90 (I-90), and arterial roads, such as Fillmore Avenue, Jefferson Avenue, Main Street, and Genesee Street, to accommodate the increase in traffic and delays without major capacity improvements, particularly on the impacted freeway segments and affected intersections which are typically the restricting points in the roadway network.

1. Intersections

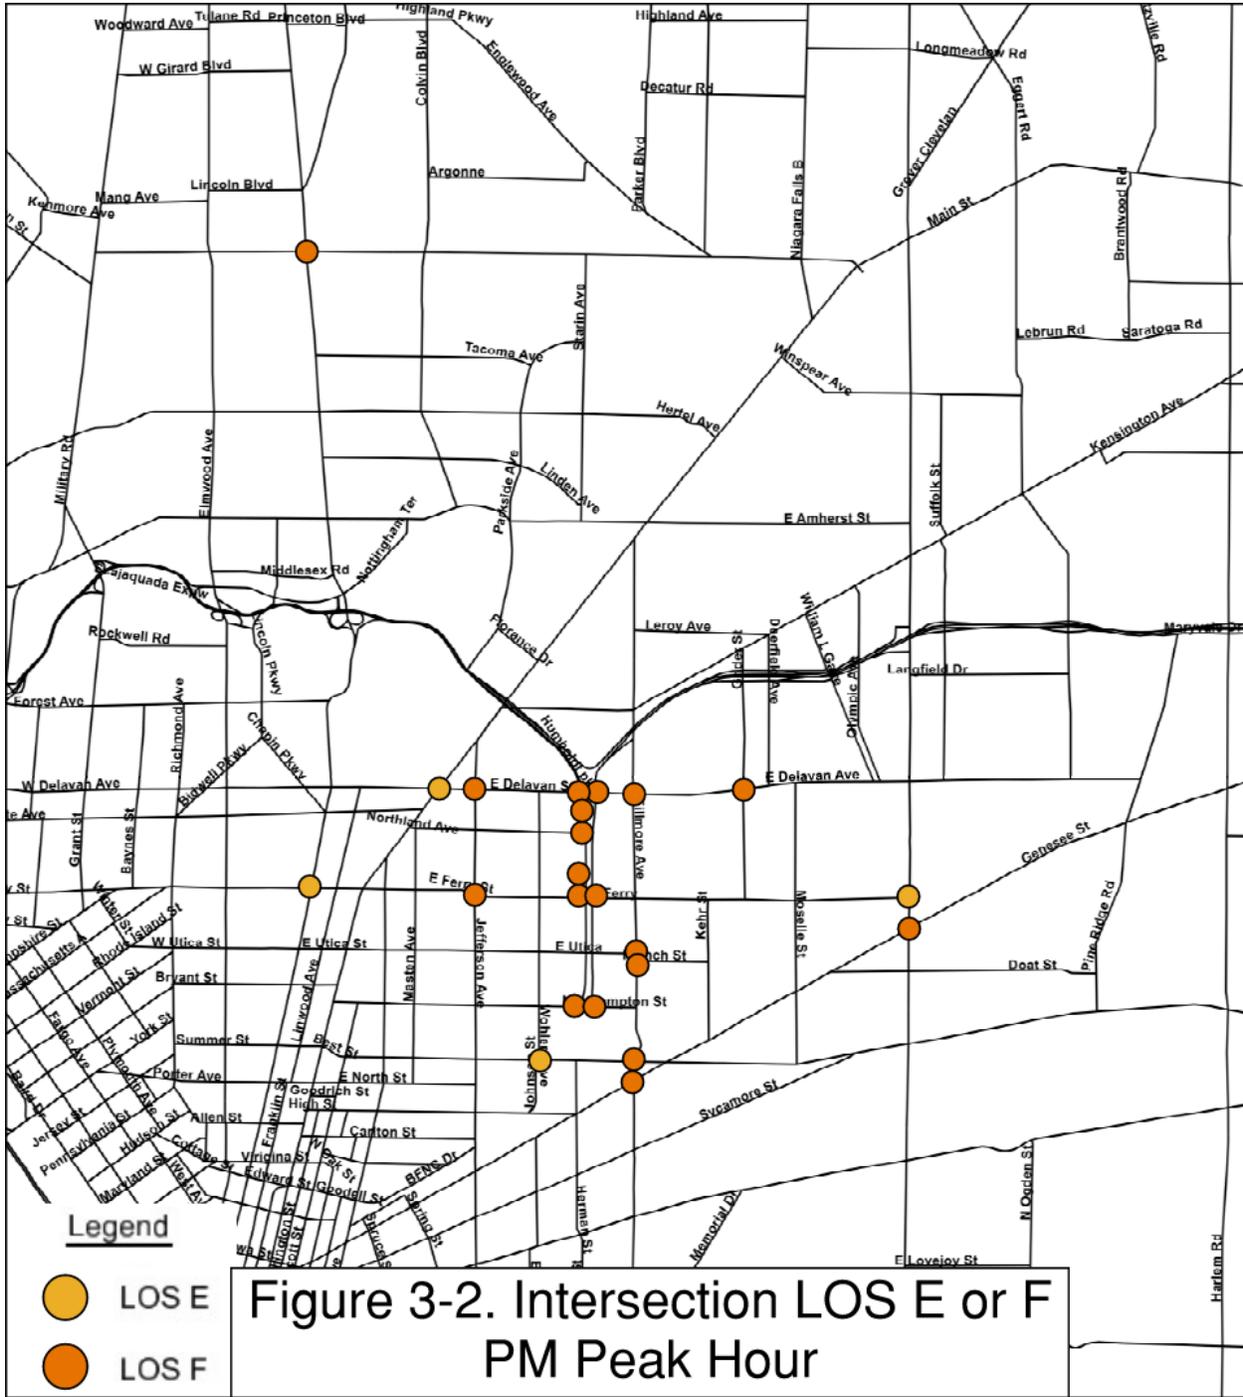

The full traffic analysis results (LOS, delay, and queue lengths) for intersections analyzed for the No-Build versus Concept 10 scenarios are documented in Appendix A-7.

The Concept 10 results show significant degradation of overall intersection Level of Service and delay at the following 42 intersections (Appendix A-7). 23 of the 42 intersections degrade to LOS of E or F with significant congestion and delay as shown in Figure 3-1 (AM peak) and 3-2 (PM peak).

Tables 5-1 and 5-2 summarize intersections with major and minor LOS impacts for Concept 10.

42 intersections have major degradation of overall operations defined as multiple LOS letter grade change, or overall letter grade change with 20 seconds or greater increased delay.

2. Road Segments

A traffic analysis was performed using Synchro software to compare the No-Build and Concept 10 scenarios for roadway corridor impacts due to increased redistributed traffic. Tables 6-1 (AM peak and 6-2 (PM peak) summarize overall LOS, travel time, vehicle speeds, emissions, and fuel consumption for select roadways which were identified as primary diversion routes.

The analysis of segment travel speed, emission and fuel usage indicates that corridors closest to the project area, including Humboldt Parkway NB and SB, Jefferson Avenue, Fillmore Avenue, Bailey Ave, Main St, and Genesee Street are expected to experience reductions in travel speed and increased vehicle emission and fuel usage as a result of the Kensington Expressway removal.

The AM peak travel speeds along the Humboldt Parkway NB and SB corridors would decrease as much as 85.2% to an average of 1.3 mph. Travel speeds along the Jefferson Avenue, Fillmore Avenue, Main Street, Genesee Street, and Bailey Avenue corridors would decrease from 1.3% to as much as 86.1%. The corresponding total peak hour delay time per roadway would increase from 63 hours to 2,163 hours for the study roadways as noted in Table 7-1 of the study.

The PM peak travel speeds along the Humboldt Parkway NB and SB corridors would decrease as much as 82.2% to an average of 0.8 mph. Travel speeds along the Jefferson Avenue, Fillmore Avenue, Main Street, Genesee Street, and Bailey Avenue corridors would decrease from 5.6% to as much as 92.0%. The corresponding total peak hour delay time per roadway would increase from 224 hours to 2,894 hours for the study roadways as noted in Table 7-2 of the study.

| Humboldt Pkwy NB & SB | Northampton St | E Delavan Ave | 361.2 | 3255.2 | 2894.0 |
| Jefferson Ave | Genesee St | E Delavan Ave | 146.3 | 1085.7 | 939.4 |
| Bailey Ave | William St | E Delavan Ave | 292.4 | 516.8 | 224.4 |
| Genesee St | Jefferson Ave | Fillmore Ave | 341.6 | 1028.4 | 686.8 |
| Main St | E Ferry St | Kensington Ave | 1423.3 | 2007.0 | 583.7 |

In conclusion, delays and operating speeds would be impacted by implementing Concept 10. The greatest impacts can be expected in the immediate project area and adjacent corridors including Humboldt Parkway NB & SB, Fillmore Avenue, Jefferson Avenue, Main Street, Bailey Avenue, and Genesee Street. The local street network and intersections would not operate at an acceptable LOS and would not be able to adequately accommodate the volume of redistributed traffic from the Kensington Expressway.

3. Freeways

The study area was simulated and analyzed using Vissim11. The Levels of Service for freeways, ramps and weave sections are defined in terms of traffic density. Density is the average number of vehicles per lane per mile. Levels of Service range from A to F, where “A” indicates free-flow traffic and “F” indicates significant congestion and delay. The following Table 8 provides a summary of the Level of Service thresholds as defined in the Highway Capacity Manual.

PIN 5512.52
Concept 10 Kensington Removal Traffic Study
January 22, 2024

Table 8 – Level of Service by Density

| Level of Service | Mainline Thresholds | Weaving & Ramp Thresholds |
|-------------------------------|------------------------|---------------------------|
| A – Free flow | Less than 11 v/la-mi | Less than 10 v/la-mi |
| B – Reasonable free flow | 11.1 to 18.0 v/la-mi | 10.1 to 20.0 v/la-mi |
| C – Stable flow | 18.1 to 26.0 v/la-mi | 20.1 to 28.0 v/la-mi |
| D – Approaching unstable flow | 26.1 to 35.0 v/la-mi | 28.1 to 35.0 v/la-mi |
| E – Unstable flow | 35.1 to 45.0 v/la-mi | More than 35.1 v/la-mi |
| F – Breakdown flow | More than 45.0 v/la-mi | V/C More than 1 |

The Concept 10 traffic model predicts that vehicles would experience increased density volumes and lower speeds on already near-capacity roadways and ramps. The comparison of traffic operation at No-Build versus Concept 10 ETC+20 PM Peak Hour scenarios is summarized in Tables 9-1 (AM peak) and 9-2 (PM peak) for travel time and speed, and Tables 10-1 (AM peak) and 10-2 (PM peak) for density and LOS.

Significant degradation of LOS and vehicle speed is expected at:

- NYS Route 198 Eastbound between Parkside and NYS Route 33,
- I-90 Eastbound between I-190 and NYS Route 33,
- I-90 Westbound between Cleveland and Walden,
- I-90 Eastbound Between William and Walden,
- I-190 Northbound between Route 5 Skyway and Route 198,
- I-190 Eastbound between Michigan and Ogden.
- I-90 Westbound Ramp to NYS Route 33 Westbound,
- I-190 Eastbound Between NYS Route 198 and the Peace Bridge

Other segments and ramps are projected to experience increased density, degraded LOS, or reduced vehicle speed.

a) Additional Considerations:

The traffic study also considered proposed road diets and bicycle lanes, safety, crash history, and air quality impacts as they relate to Concept 10.

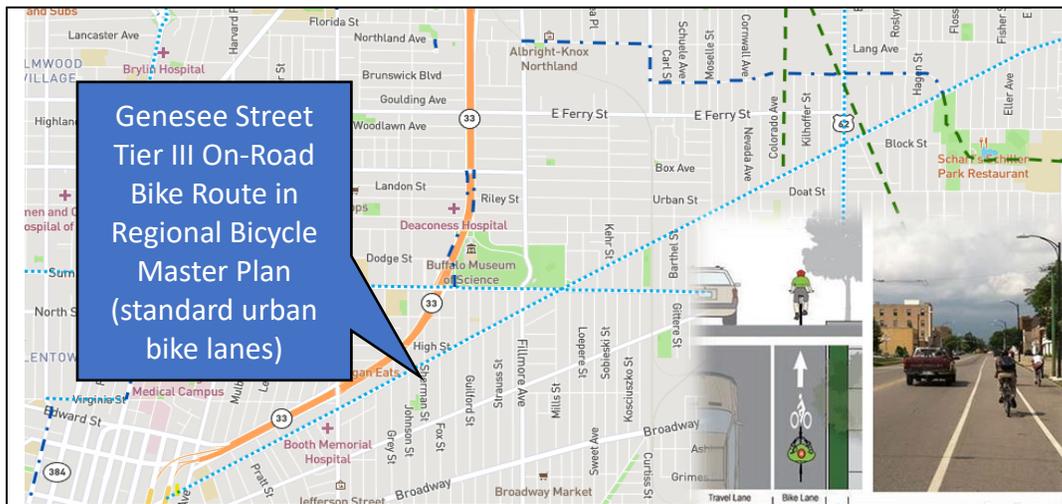

I. Road Diets & Bicycle Lanes

The following roadways are programmed for road diets and/or bike lane additions in accordance with the Bike Buffalo Niagara Regional Bicycle Master Plan¹ (refer to Table 11) and the GBNRTC 2023-2027 TIP.² (refer to Table 12). These projects were incorporated into the traffic modeling and further reduce the number of lanes and capacity of the affected roadways for vehicular traffic.

Table 11 – Bike Buffalo Niagara Regional Bicycle Master Plan

| Proposed project | Trail Tier | Agency |
|--|------------|------------------------------|
| Main St: Delavan Ave to Harlem Rd | 2 | Amherst & Buffalo |
| Main St: Virginia St to Ferry St | 2 | Buffalo |
| Humboldt Pkwy: Parkside Ave to Main St | 2 | Amherst & Buffalo |
| Fillmore Ave: Glenny Park to Main St | 3 | Buffalo |
| W. Delavan Ave: Delaware Ave to Jefferson Ave | 2 | Buffalo |
| Delaware Ave: North St to Forest Ave | 3 | Buffalo |
| Jefferson Ave: Delavan Ave to Trail | 2 | Buffalo |

TIP Projects in Project Traffic Study Area

II. Pedestrian and Bicyclist Safety

An advantage of accommodating regional traffic movements on an expressway is that direct conflicts with pedestrians and bicyclists are avoided. Pushing traffic flows onto local streets that are also used by pedestrians and bicyclists would increase the number of crashes, injuries and fatalities affecting these vulnerable road users. Further, adding traffic to surface roads conflicts with local and regional plans. For example, Genesee Street is designated a proposed on-road bicycle route in the Regional Bicycle Master Plan. Installing bicycle lanes on the four-lane sections of Genesee Street would likely require a road diet (reduction in travel lanes).

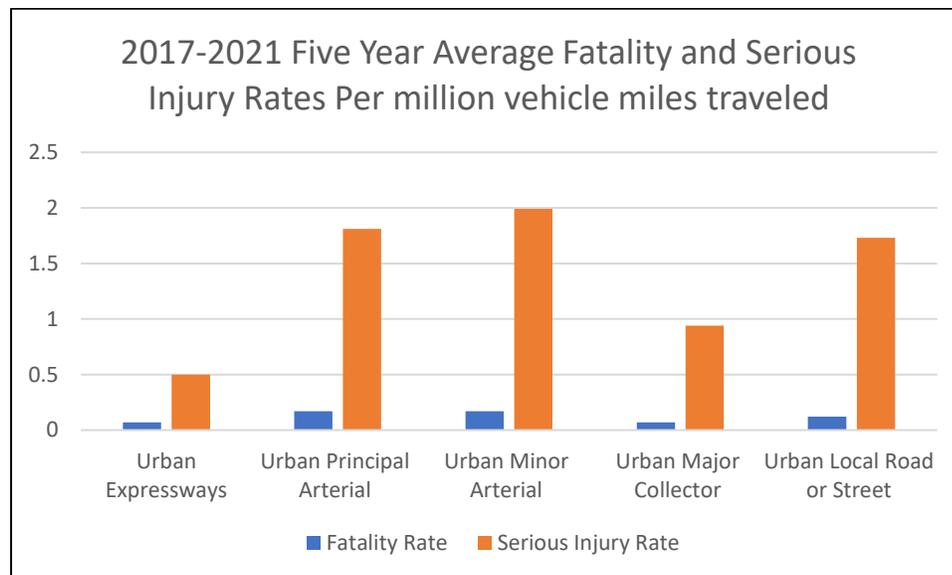

- Crash rates on expressways are substantially lower than on roadways that are not access controlled as shown in Table 13.³ Despite higher speeds, fatality and injury rates are also lower.
- Controlled access facilities eliminate some of the conflicts associated with crashes at intersections, such as left turns.

III. NY Route 33/I-90 Interchange Crash History

NYSDOT’s Crash Location and Engineering Analysis Repository (CLEAR) safety management system was used to collect safety data for the NY 33 & I-90 interchange. The area includes the full interchange and ramps plus I-90 up to Cleveland Dr where it begins to split to I-290. A total of 460 crashes occurred during the most recent 3-year study period. This already problematic interchange would see increases in the number of crashes, injuries, and fatalities due to additional redistributed volumes.

IV. Regional Air Quality

The GBNRTC regional model includes an emissions calculation function based on MOVES emissions factors. The emission factors are intended for regional-planning level comparisons of different options and do not reflect detailed traffic operations information about delay or queues at specific intersections. The model estimates daily emissions for the entire transportation network. Comparing the emissions for the 2019 No Build and 2019 Concept 10 conditions demonstrates that the changes in vehicle routing under Concept 10 would result in a small net increase in emissions in the region as shown in Table 14. Specifically,

PIN 5512.52
Concept 10 Kensington Removal Traffic Study
January 22, 2024

- VOCs/hydrocarbons: 0.5% increase
- NOx: 0.2% increase
- CO: 0.4% increase
- PM10: 0.4% increase
- PM2.5: 0.4% increase

Greenhouse gas emissions (CO₂-equiv) would also increase by 0.3%.

Although not modeled in detail, it can be inferred from the traffic analysis that specific roadway segments and intersections with a substantial increase in volumes and delay would also experience increased mobile source emissions. Vehicle emissions of CO, PM_{2.5}, NO_x, and VOC under stop-and-go traffic conditions on local streets with traffic signals result in higher emissions than the same traffic travelling in free-flow conditions on an expressway.

Table 14 – GBNRTC Regional Model Daily Emissions

| Daily Emissions (grams) | Existing Conditions 2019 | Concept 10 2019 | Change (grams) | % Change |
|--|--------------------------|-----------------|----------------|----------|
| | Total (grams) | Total (grams) | | |
| Gaseous Hydrocarbons (HCS) | 1,956,751 | 1,966,670 | 9,919 | 0.51% |
| Carbon Monoxide (CO) | 72,048,140 | 72,308,266 | 260,126 | 0.36% |
| Oxides of Nitrogen (NO _x) | 7,427,729 | 7,444,062 | 16,333 | 0.22% |
| Methane (MH ₄) | 337,721 | 339,416 | 1,695 | 0.50% |
| Nitrous Oxide (N ₂ O) | 51,021 | 51,486 | 465 | 0.91% |
| Sulfur Dioxide (SO ₂) | 54,791 | 54,957 | 166 | 0.30% |
| Atmospheric CO ₂ | 8,805,655,051 | 8,832,334,439 | 26,679,388 | 0.30% |
| CO ₂ Equivalent (CO ₂ e) | 8,829,299,248 | 8,856,159,471 | 26,860,223 | 0.30% |
| Primary Exhaust PM ₁₀ – Total | 177,866 | 178,560 | 694 | 0.39% |
| Primary PM ₁₀ – Brakewear | 902,466 | 914,312 | 11,846 | 1.31% |
| Primary PM ₁₀ – Tirewear | 254,673 | 255,493 | 820 | 0.32% |
| Primary Exhaust PM ₂₅ – Total | 160,856 | 161,488 | 632 | 0.39% |
| Primary PM ₂₅ – Breakwear | 112,808 | 114,289 | 1,481 | 1.31% |
| Primary PM ₂₅ – Tirewear | 38,201 | 38,324 | 123 | 0.32% |

A second, independent air emission calculation was provided using the Synchro microsimulation traffic model for adjacent arterial roadways. The Synchro model estimates PM peak hour emissions for the identified corridors in Tables 6 and 7. The traffic simulation analysis for specific roadway segments and intersections with volume increases and delay also experience increased mobile source emissions. Vehicle emissions of CO, HC, and No_x under stop-and-go traffic conditions on local streets with traffic signals result in higher emissions.

General findings for the Kensington Expressway Removal with redistributed traffic onto local roadways indicate:

- Vehicle emissions under stop-and-go traffic conditions on local streets with traffic signals result in higher emissions than the same traffic travelling in free-flow conditions on an expressway.

PIN 5512.52
Concept 10 Kensington Removal Traffic Study
January 22, 2024

- As vehicles accelerate away from an intersection on a green signal, this increases engine load and emissions. Emission rates (e.g., grams of pollutant per mile travelled) when average speeds are 0 to 20 mph (as occurs on over-capacity roadways) can be four times higher than the emission rates on roadways with speeds between 25 and 75 mph.
- Thus, NYS Route 33 Removal increases mobile source emissions regionally and near specific locations.

4. Concept 10 Construction Cost Estimate:

An opinion of probable construction cost is defined as a level one cost estimate to facilitate budgetary and feasibility determinations, based on historical information with adjustments made for specific project conditions. Preliminary cost estimates indicate that the Concept 10 cost including filling in, and costs associated with mitigation measures required to accommodate the traffic diversions would likely exceed twice the cost of the current project.
